

# iMOTION™ IMC100

## High performance motor control IC series

IMC100

Quality Requirement Category: Industry

### Feature list

- Motion Control Engine (MCE) as ready-to-use solution for variable speed drives
- Field oriented control (FOC) for permanent magnet synchronous motor (PMSM)
- Space vector PWM with sinusoidal commutation and integrated protection features
- Current sensing via single or leg shunt
- Sensorless operation
- Optional support for hall sensors (analog or digital)
- Optional boost or totem pole PFC control integrated
- Flexible host interface options for motor control commands: UART, PWM or analog input signal
- Support for IEC 60335 ('Class B')
- Integrated scripting engine for application flexibility
- Multiple package options

### Applications

- Refrigerators
- Home appliances
- Pumps, fans
- ...any other PMSM drive

**Description**

**Description**

iMOTION™ IMC100 is a family of highly integrated ICs for the control of variable speed drives. By integrating both the required hardware and software to perform control of a permanent magnet synchronous motor (PMSM) they provide the shortest time to market for any motor system at the lowest system and development cost.

**About this document**

**Scope and purpose**

This Datasheet describes the mechanical, electrical and functional characteristics of the iMOTION™ IMC100 series of motor control ICs. If no specific device is given the characteristics are valid for all devices within the iMOTION™ IMC100 series.

For a detailed description of the functionality and configuration options please refer to the reference manual of the Motion Control Engine.

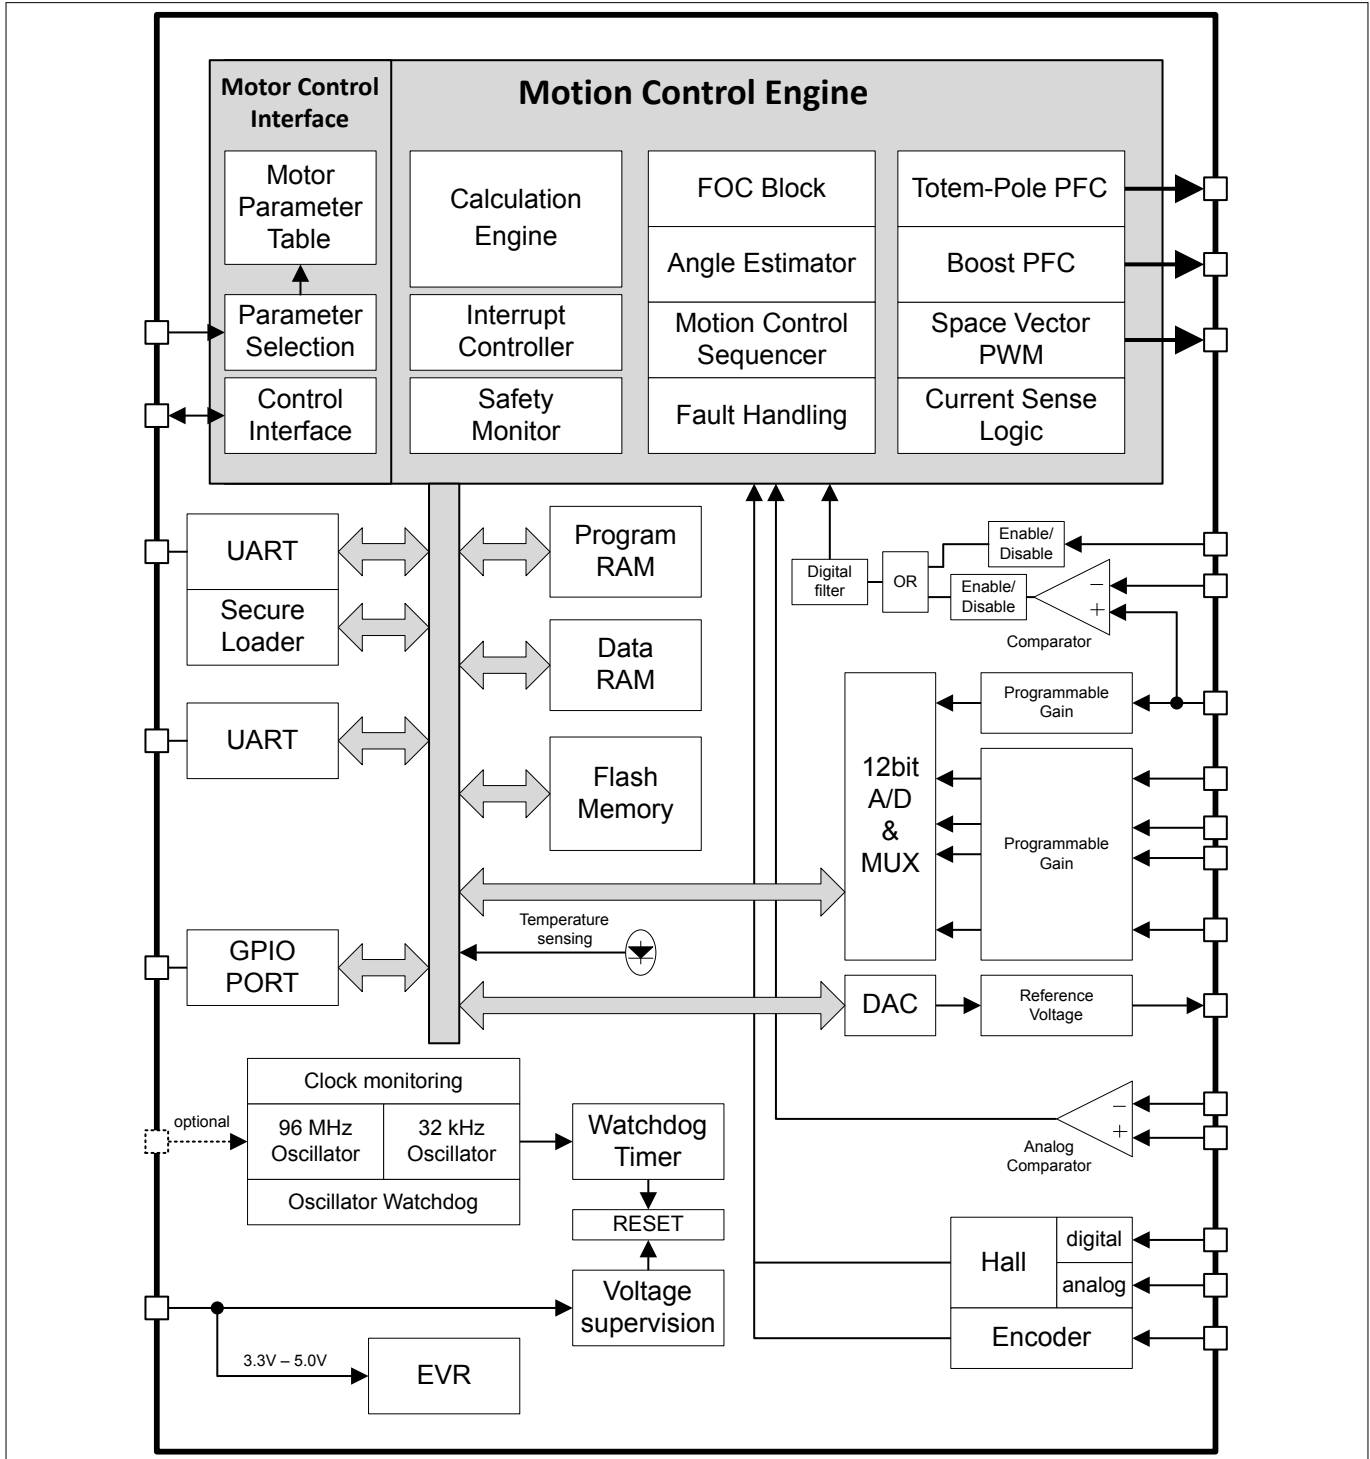

**Intended audience**

The Datasheet is targeting developers implementing a variable speed drive.

**Block Diagram Reference**

**1 Block Diagram Reference**

The block diagram below gives an overview on the available functional units in the iMOTION™ IMC100 family. Not all units are required in all applications and some modules might share pins in smaller packages. Please refer to the pin configuration for the individual packages and the application schematic examples given.

**Figure 1 Block diagram**

**Pin Configuration**

## 2 Pin Configuration

The following tables give the pin configurations of the individual devices of the IMC100 series in the available packages.

The pin type is specified as follows:

- I - digital input
- O - digital output
- AIN - analog input

The pin function given below refers to the standard software configuration. Different software might configure pins differently. Some of the input pins can be configured to have pull up or pull down resistor and some output pins can be configured to push-pull or open drain. This is described in the reference manual of the respective software.

Pins that do not have any signal assigned are reserved for future use. These pins should be left unconnected and neither be connected to ground nor to the positive supply.

*Note: All required reference voltages are generated by an internal DAC, therefore the pins like REFU, REFV, REFW and PFCREF only require a blocking capacitor.*

**Functional description**

### **3 Functional description**

iMOTION™ IMC100 is a series of highly integrated ICs for the control of a Permanent Magnet Synchronous Motor (PMSM). IMC101 devices provide control of a single motor while the IMC102 devices control the motor and additionally a boost or totem pole power factor correction (PFC).

The IMC100 series is based on Infineon's Motion Control Engine (MCE) and integrate all hardware and software functions required to implement a closed loop sensorless (or optionally sensor based) control algorithm for permanent magnet motors. IMC100 devices do not require any software programming and can be configured for a wide range of motor control inverters.

The IMC100 series takes advantage of a new hardware platform that is based on a comprehensive set of innovative analog and motor control peripherals. The high level of integration both in terms of hardware modules and software algorithms results in a minimum number of external components required for the implementation of the inverter control.

Infineon's patented and field proven Motion Control Engine (MCE) implements field oriented control (FOC) using single or leg shunt current feedback and uses space vector pulse width modulation (PWM) with sinusoidal signals to achieve highest energy efficiency. In addition to the motor control algorithm it also integrates multiple configurable protection features like over- and under-voltage, over current, rotor lock etc. to protect both the power stage as well as the motor during application tuning or in case of malfunction.

The second generation of the MCE further improves the performance of the sensorless control algorithm and adds functionality like optional sensor support for applications that require accurate rotor positioning, two types of ready-to-use PFC algorithms as well as more and flexible and faster host interface options.

The IMC100 series is offered in several device and package variants for applications from single motor control to motor control plus PFC. All devices can be used in applications requiring functional safety according to IEC 60335 ('Class B').

There are multiple versions of the MCE software offered by Infineon and made available for download from the Infineon web site.

By using a special secure boot loader algorithm in combination with type specific chip IDs it is assured that these MCE software versions can only be installed onto the matching hardware derivatives, i.e. IMC100 variants for which the software has been tested and released for. Infineon provides the tools to program these software images for download from the website.

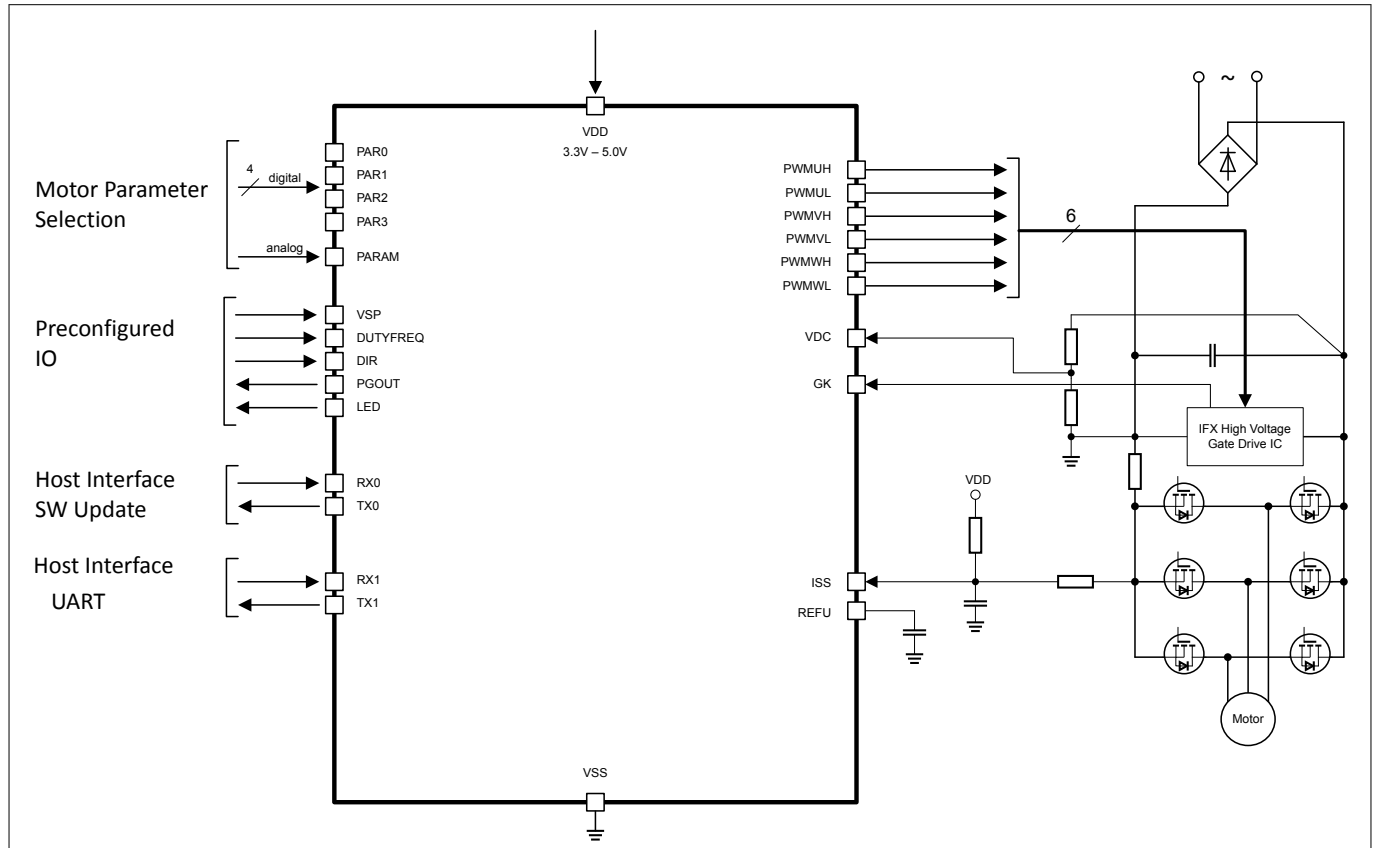

This data sheet provides all electrical, mechanical, thermal and quality parameters. A detailed description of the features, functionality and configuration of the Motion Control Engine (MCE) can be found in the respective reference manual of the MCE.

The application schematics in the following chapters show some examples of different use cases for the IMC100 devices. The combination of the different configuration options like leg vs. single shunt, sensorless or sensed operation, boost or totem pole PFC etc. is not limited to the examples shown here but can be chosen according to the individual application requirements.

**Electrical characteristics and parameters**

## 4 Electrical characteristics and parameters

### 4.1 General Parameters

#### 4.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the IMC100 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the “Symbol” column:

- **CC**  
 Such parameters indicate **C**ontroller **C**haracteristics, which are distinctive feature of the IMC100 and must be regarded for a system design.
- **SR**  
 Such parameters indicate **S**ystem **R**equirements, which must be provided by the application system in which the IMC100 is designed in.

#### 4.1.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Table 3 Absolute Maximum Rating Parameters**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Ambient temperature	$T_A$ SR	-40	–	105	°C	–
Junction temperature	$T_J$ SR	-40	–	115	°C	–
Storage temperature	$T_{ST}$ SR	-55	–	125	°C	–
Voltage on power supply pin with respect to $V_{SSP}$	$V_{DDP}$ SR	-0.3	–	6	V	–
Voltage on digital pins with respect to $V_{SSP}$	$V_{IN}$ SR	-0.3	–	$V_{DDP} + 0.3$ or max. 6	V	whichever is lower
Voltage on analog input pins with respect to $V_{SSP}$	$V_{AIN}$ $V_{AREF}$ SR	-0.5	–	$V_{DDP} + 0.5$ or max. 6	V	whichever is lower
Input current on any pin during overload condition	$I_{IN}$ SR	-10	–	10	mA	–
Absolute maximum sum of all input currents during overload condition	$\sum I_{IN}$ SR	-50	–	+50	mA	–

**Electrical characteristics and parameters**

**4.1.3 Pin Reliability in Overload**

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

**Table 4** defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- **Operating Conditions** are met for
  - pad supply levels ( $V_{DDP}$ )
  - temperature

If a pin current is outside of the **Operating Conditions** but within the overload conditions, then the parameters of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

*Note:* An overload condition on one or more pins does not require a reset.

*Note:* A series resistor at the pin to limit the current to the maximum permitted overload current is sufficient to handle failure situations like short to battery.

**Table 4 Overload Parameters**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Input current on analog port pins during overload condition	$I_{OVA}$ SR	-3	-	3	mA	
Input current on any port pin during overload condition	$I_{OV}$ SR	-5	-	5	mA	
Absolute sum of all input circuit currents during overload condition	$I_{OVS}$ SR	-	-	25	mA	

**Electrical characteristics and parameters**

Figure 10 shows the path of the input currents during overload via the ESD protection structures. The diodes against  $V_{DDP}$  and ground are a simplified representation of these ESD protection structures.

**Figure 10 Input Overload Current via ESD structures**

Table 5 and Table 6 list input voltages that can be reached under overload conditions. Note that the absolute maximum input voltages as defined in the **Absolute Maximum Ratings** must not be exceeded during overload.

**Table 5 PN-Junction Characteristics for positive Overload**

Pad Type	$I_{OV} = 5 \text{ mA}$
Standard, High-current, AN/DIG_IN	$V_{IN} = V_{DDP} + (0.3 \dots 0.5) \text{ V}$ $V_{AIN} = V_{DDP} + 0.5 \text{ V}$ $V_{AREF} = V_{DDP} + 0.5 \text{ V}$

**Table 6 PN-Junction Characteristics for negative Overload**

Pad Type	$I_{OV} = 5 \text{ mA}$
Standard, High-current, AN/DIG_IN	$V_{IN} = V_{SS} - (0.3 \dots 0.5) \text{ V}$ $V_{AIN} = V_{SS} - 0.5 \text{ V}$ $V_{AREF} = V_{SS} - 0.5 \text{ V}$

**Electrical characteristics and parameters**

**4.1.4 Operating Conditions**

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the IMC100. All parameters specified in the following tables refer to these operating conditions, unless noted otherwise.

**Table 7 Operating Conditions Parameters**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.

**4.3.2 Power-Up and Supply Threshold Characteristics**

This chapter provides the characteristics of the supply threshold in IMC100.

The guard band between the lowest valid operating voltage and the brownout reset threshold provides a margin for noise immunity and hysteresis. The electrical parameters may be violated while  $V_{DDP}$  is outside its operating range.

The brownout detection triggers a reset within the defined range. The prewarning detection can be used to trigger an early warning and issue corrective and/or fail-safe actions in case of a critical supply voltage drop.

*Note:* These parameters are not subject to production test, but verified by design and/or characterization.

*Note:* Operating Conditions apply.

**Table 12 Power-Up and Supply Threshold Parameters**

	$S_{VDDP10}$ SR	0	–	10	V/ $\mu s$	Slope during fast transient within +/-10% of $V_{DDP}$
	$S_{VDDPrise}$ SR	0	–	10	V/ $\mu s$	Slope during power-on or restart after brownout event
	$S_{VDDPfall}$ <sup>9)</sup> SR	0	–	0.25	V/ $\mu s$	Slope during supply falling out of the +/-10% limits <sup>10)</sup>
$V_{DDP}$ prewarning voltage	$V_{DDPPW}$ CC	2.1	2.25	2.4	V	ANAVDEL.VDEL_SELECT = 00 <sub>B</sub>
		2.85	3	3.15	V	ANAVDEL.VDEL_SELECT = 01 <sub>B</sub>
		4.2	4.4	4.6	V	ANAVDEL.VDEL_SELECT = 10 <sub>B</sub>

$V_{DDP}$ voltage to ensure defined pad states	$V_{DDPPA}$ CC	–	1.0	–	V	

<sup>9</sup> A capacitor of at least 100 nF has to be added between VDDP and VSSP to fulfill the requirement as stated for this parameter.

<sup>10</sup> Valid for a 100 nF buffer capacitor connected to supply pin where current from capacitor is forwarded only to the chip. A larger capacitor value has to be chosen if the power source sink a current.

**4.6 Control Interface Parameters**

The following tables specify the interfaces that can be used to control the motor drive in the application.

**4.6.1 Serial Interface Parameters**

The IMC100 series provides the following communication interfaces.

*Note:* These parameters are not subject to production test, but verified by design and/or characterization.

**4.6.1.1 UART Interface**

The UART interface is configured as given below.

*Note:* Operating Conditions apply.

**Table 22 Electrical characteristics**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
UART baud rate		1200	57600	-	Bps

**Figure 16 UART timing**

<sup>14)</sup> Each bit including start and stop bit is sampled three times at center of a bit at an interval of  $1/16 T_{BAUD}$ . If three sampled values do not agree, then UART noise error is generated.

**Electrical characteristics and parameters**

**4.6.2 Analog Speed Input**

**Figure 17 VSP analog control mode**

**Table 23 Analog Speed Control Voltage (VSP)**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Motor start voltage	$VSP_{START}$	-	1.2	-	V	Configured $VSP_{START}=1.0V$
Motor stop voltage	$VSP_{STOP}$	-	1.0	-	V	Configured $VSP_{STOP}=1.0V$
Motor max voltage	$VSP_{MAX}$	-	4.9	4.95	V	$V_{DD}=5.0V$
VSP active to PWM start	$t_{START}$	-	44	-	ms	
VSP inactive to PWM stop	$t_{STOP}$	-	16	-	ms	

**Electrical characteristics and parameters**

**4.6.3 Frequency Input**

In frequency input control mode, the motor operations like motor start, motor stop and speed change are controlled by applying a square wave frequency signal on a digital input pin.

**Figure 18 Frequency input control mode**

**Table 24 Frequency Control Mode**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Motor start frequency	$f_{START}$	-	100	360	Hz	$f_{START} > f_{STOP}$
Motor stop frequency	$f_{STOP}$	-	50	-	Hz	
Motor max speed frequency	$f_{MAX}$	-	-	1000	Hz	
Frequency input duty cycle	$T_{DUTY}$	10	-	90	%	

**Electrical characteristics and parameters**

**4.6.4 Duty Cycle Input**

In duty cycle input control mode, the motor operations like motor start, stop and speed change are controlled by varying the duty cycle of a rectangular wave signal on a digital input pin.

**Figure 19 Duty cycle input control mode**

**Table 25 Duty Cycle Control Mode**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Input signal frequency	$f_{DUTY}$	5	1000	20000	Hz	
Motor start duty cycle	$T_{START}$	-	10	-	%	$T_{START} > T_{STOP}$
Motor stop duty cycle	$T_{STOP}$	-	5	-	%	
Motor max duty cycle	$T_{MAX}$	-	95	-	%	

**Electrical characteristics and parameters**

**4.6.5 Over Temperature Input**

The over temperature input can be used to continuously monitor an external temperature sensor like an NTC.

**Table 26 Over Temperature Input**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Over Temperature Input Threshold	$V_{OT}$	0.1	1.0	3.0	V	$V_{DD}=3.3V$ , Configurable parameter e.g. via MCEDesigner, default=1.0V
Over Temperature to PWM shutdown	$t_{OT}$		1.0	2.1	ms	

**4.6.6 Pulse Output**

The IMC100 series can generate a square wave pulse output in sync with the motor rotation which can be used to monitor the motor speed. The number of pulses to be generated for a full rotation can be configured.

**Table 27 Pulse Output**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Pulses per Rotation	$PPR$	4	-	24		
Pulse duty cycle	$t_{PPR}$	-	50	-	%	

**4.6.7 LED Output**

The IMC100 series provides an output that can be connected to an LED to give a visual indication of the status of the motor drive.

**Table 28 LED Output**

Parameter	Symbol	Values			Unit	Note or test condition
		Min.	Typ.	Max.		
Fault to LED delay	$t_{LEDFault}$	-	53	-	ms	
Fault reset to LED delay	$t_{LEDRESET}$	-	1.84	-	ms	
LED blinking frequency	$f_{LED}$	1		1000	Hz	
LED blinking duty cycle	$t_{LED}$	5		95	%	

**Electrical characteristics and parameters**

**4.7 Quality Declaration**

**Table 29** shows the characteristics of the quality parameters in the IMC100.

**Table 29 Quality Parameters**

**5.2 Thermal Considerations**

**Table 30 Thermal Characteristics of the Packages**

Parameter	Symbol	Limit Values		Unit	Package Types
		Min.	Max.		
Exposed Die Pad Dimensions	$E_x \times E_y$ CC	-	4.2 × 4.2	mm	PG-VQFN-48-73
Thermal resistance Junction-Ambient <sup>1)</sup>	$R_{\theta JA}$ CC	-	86.0	K/W	PG-TSSOP-38-9
		-	44.9	K/W	PG-VQFN-48-73
		-	t.b.d.	K/W	PG-TQFP-48
		-	66.7	K/W	PG-LQFP-64-26

*Note: For electrical reasons, it is required to connect the exposed pad to the board ground  $V_{SSP}$ , independent of EMC and thermal requirements.*

When operating the IMC100 in a system, the total heat generated in the chip must be dissipated to the ambient environment to prevent overheating and the resulting thermal damage.

The maximum heat that can be dissipated depends on the package and its integration into the target board. The “Thermal resistance  $R_{\theta JA}$ ” quantifies these parameters. The power dissipation must be limited so that the average junction temperature does not exceed 115°C.

The difference between junction temperature and ambient temperature is determined by

$$\Delta T = (P_{INT} + P_{IOSTAT} + P_{IODYN}) \times R_{\theta JA}$$

The internal power consumption is defined as

$$P_{INT} = V_{DDP} \times I_{DDP} \text{ (switching current and leakage current).}$$

The static external power consumption caused by the output drivers is defined as

$$P_{IOSTAT} = \Sigma((V_{DDP} - V_{OH}) \times I_{OH}) + \Sigma(V_{OL} I_{OL})$$

The dynamic external power consumption caused by the output drivers ( $P_{IODYN}$ ) depends on the capacitive load connected to the respective pins and their switching frequencies.

If the total power dissipation for a given system configuration exceeds the defined limit, countermeasures must be taken to ensure proper system operation:

- Reduce  $V_{DDP}$ , if possible in the system
- Reduce the system frequency
- Reduce the number of output pins
- Reduce the load on active output drivers
