

SCM3401B Half-duplex Transceiver

Features

- 5.0V single supply operation
- Baud Rate Up to 1Mbps
- 1/8 Unit Load—Up to 256 Nodes on a Bus
- Low Quiescent Power
 - 0.3mA Active Mode
 - 50nA Shutdown Mode
- Bus-Pin ESD Protection Up to 15 kV
- Driver short circuit protection

Package

Mechanical package: DFN 3X3
(see "Ordering information" for details).

Applications

- Industrial Automation
- Building Automation
- Smart Electricity Meter
- Remote Signal Interaction, Transmission

Functional Description

SCM3401B is a half-duplex enhanced transceiver designed for RS-485 data bus networks. Powered by 5V supply, the SCM3401B is fully compliant with TIA/EIA-485A standard and is suitable for data transmission of up to 1 Mbps. Receivers have an exceptionally high input impedance, which places only 1/8 of the standard load on a shared bus and up to 256 transceivers.

The reliability design of A B pin is emphasized, including driver output over current protection and enhanced ESD design. The ESD protection level of A,B pin can be up to 15KV (Human Body Model).

Function table

Driver					Receiver			
Input			Outputs		Input			Output
\overline{RE}	DE	DI	A	B	\overline{RE}	DE	A-B	RO
X	H	H	H	L	L	X	$\geq -10\text{mV}$	H
X	H	L	L	H	L	X	$\leq -200\text{mV}$	L
L	L	X	Z	Z	L	X	Open/Short	H
H	L	X	Z (SHUTDOWN)		H	H	X	Z
					H	L	X	Z (SHUTDOWN)

Pin descriptions

Pin Number	Pin Name	Pin Functions
1	RO	Receiver Output. When \overline{RE} is low and if $(A - B) \geq -10\text{mV}$, RO is high. If $(A - B) \leq -200\text{mV}$, RO is low.
2	\overline{RE}	Receiver Output Enable. When \overline{RE} is low, RO is enabled. When \overline{RE} is high, RO is high impedance. Drive \overline{RE} high and DE low to enter shutdown mode.
3	DE	Driver Output Enable. When DE is high, outputs are enabled. When DE is low, outputs are high impedance. Drive DE low and \overline{RE} high to enter shutdown mode.
4	DI	Driver Input.
5	GND	Ground
6	A	Non-Inverting Driver Output / Receiver input
7	B	Inverting Driver Output / Receiver input
8	VCC	Positive Supply VCC. Bypass to GND with a 0.1uF capacitor.

Absolute Maximum Ratings

General test conditions: Free-air, normal operating temperature range (unless otherwise specified).

PARAMETERS	UNIT
Supply voltage range, V_{CC}	-0.3V~+6V
Voltage range at A or B	-8V~+13V
Voltage range at DE、DI、 \overline{RE} 、RO	-0.3V~+6V
Storage Temperature	-55°C~150°C
Lead Temperature (soldering, 10s)	300°C

Important: Exposure to Absolute Maximum Rated conditions for an extended period may severely affect the device reliability, and stress levels exceeding the "Absolute Maximum Ratings" may result in permanent damage.

Recommended Operating Conditions

Recommended Operating Conditions	Min.	Nom.	Max.	Unit
Supply Voltage, V_{VCC}	4.5	5	5.5	V
Voltage at any bus terminal (differential or common mode), V_I	-7		12	
High-level input voltage (DI, DE, \overline{RE}), V_{IH}	2		V_{CC}	
Low-level input voltage (DI, DE, \overline{RE}), V_{IL}	0		0.8	
Output current	Driver	-60	60	mA
	Receiver	-8	8	
Differential load resistance	54	60		Ω
Signaling rate			1000	Kbps
Operating ambient temperature, T_A in free-air	-40		85	°C
Operating junction temperature, T_J	-40		125	°C

Electrical Characteristics

General test conditions and $V_{VCC}=5V$, $T_a = 25^\circ C$ (unless otherwise specified).

Electrical characteristics of Transmitter						
Symbol	Parameters	Test condition	Min.	Nom.	Max.	Unit
$ V_{OD} $	Differential output voltage	No-load			V_{VCC}	V
		$R_L=54\Omega$, Fig.16	1.5	2.0		V
		$V_{TEST} = -7 \sim 12V$, Fig.17	1.5		V_{VCC}

Detailed Description

The SCM3401B series are advanced RS-485 transceivers. They each contain one driver and one receiver. These devices feature a fail-safe circuitry that guarantees a high receiver output voltage when the receiver inputs are either open, shorted or when they are connected to a terminated transmission line with all drivers disabled. These devices operate with a single 5.0V supply. Drivers limit the output current by over current protection, to avoid the damage to the transceivers.

Receiver input filter

The SCM3401B receivers have an integrated input filter which enhances noise immunity of the high-speed differential signals. The receiver propagation delay increases due to this filtering.

Bus fail-safe

Ordinary RS485 bus receivers will be in an indeterminate state when $-200\text{mV} < A - B < -10\text{mV}$. This situation can occur whenever the data bus is not being actively driven. The advanced Fail-safe feature of the SCM3401B guarantees a high receiver output voltage if the receiver's differential inputs are either shorted, open circuit, or if they are connected to a termination resistor.

The SCM3401B receiver thresholds are very precise, and the offset between threshold voltage and ground has a margin of at least 10mV. This guarantees that the receiver output is a high voltage even the input differential is zero volts, thus maintaining compliance with the EIA/TIA-485 standard .

Load abilities on the bus (256 nodes)

The standard receiver input impedance of RS-485 is 12kΩ (1 unit load). A standard RS485 driver can drive at least 32 unit loads. The SCM3401B transceiver is design to 1/8th of the standard unit load and the input impedance is higher than 96kΩ, hence allowing up to 256 unit loads, in other words eight times as many. The SCM3401B can work combined with other standard RS485 that use the smaller amount of unit loads.

Low power shut down mode

A low-power shutdown mode is triggered by simultaneously bringing $\overline{\text{RE}}$ high and DE low. During shutdown mode the device supply current is 50nA typical. DE and $\overline{\text{RE}}$ can be directly connected and controlled by the same I/O. The devices are guaranteed not to enter shutdown mode if $\overline{\text{RE}}$ is high and DE is low for less than 50ns. If this state is maintain for at least 600ns, the device will shut down reliably.

Driver output protection

The device prevents excessive output current caused by fault conditions or driver short circuit. A driver current limit on the output stage provides and ensures immediate protection against short circuits over the entire common mode voltage range.

Expansion Output Design

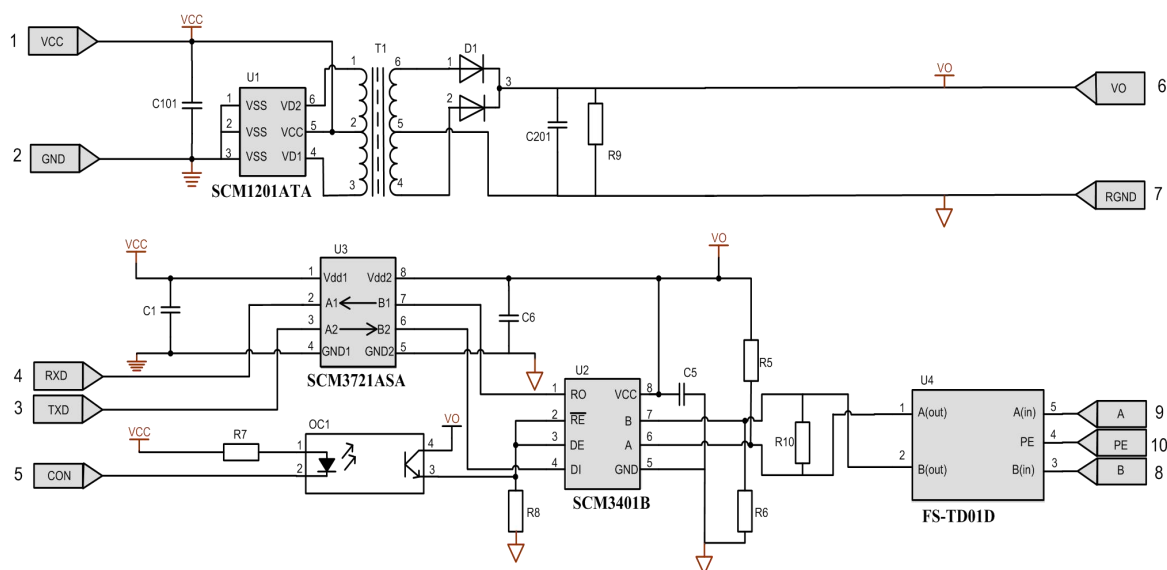

Fig. 26 Schematic diagram of isolation application circuit for UART to RS485 signal

Suggestions for Power Supply

If the input power is a few inches from the SCM3401B, as much as possible, connect a 0.1 μ F bypass capacitor to the VCC pin and a 10 μ F capacitor near the center tap pin of the transformer.
