

## FEATURES

- Fully compatible with the ISO 11898 standard
- Thermally protected
- ±58V BUS protection
- Driver (TXD) dominant overtime function
- Silent receive mode
- SIT1051AQT/E with off mode in low power consumption
- SIT1051AQT/3 can be interfaced directly to microcontrollers with supply voltages from 3V to 5V
- Undervoltage protection on VCC and VIO power supply pins
- Timing guaranteed for data rates up to 5 Mbit/s in the (CAN FD) fast phase
- The typical loop delay from TXD to RXD is less than 100ns
- Very low ElectroMagnetic Emission (EME)
- Unpowered nodes do not interfere with the bus
- Provide DFN3\*3-8/ HVSON8, Small Outline, Leadless Package

## PRODUCT APPEARANCE

Provide Green and Environmentally Friendly Lead-free package

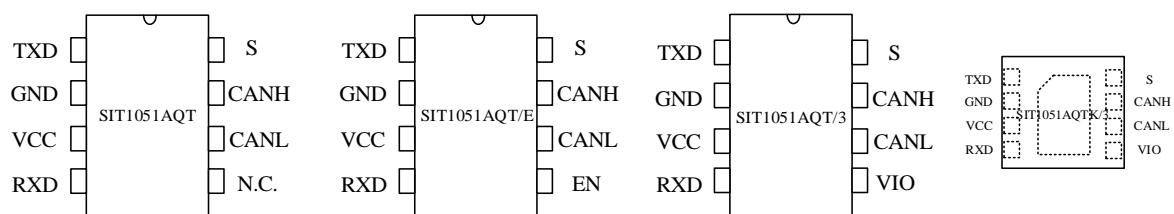

## DESCRIPTION

SIT1051AQ is an interface chip used between the CAN protocol controller and the physical bus. It can be used in trucks, buses, cars, industrial control and other fields. It supports 5Mbps (CAN FD), and has the ability to perform differential signal transmission between bus and the CAN protocol controller. The SIT1051AQ is an upgraded version of the SIT1051Q with improved bus signal symmetry and lower electromagnetic radiation performance. In addition, the SIT1051AQ is fully compatible with SIT1051Q.

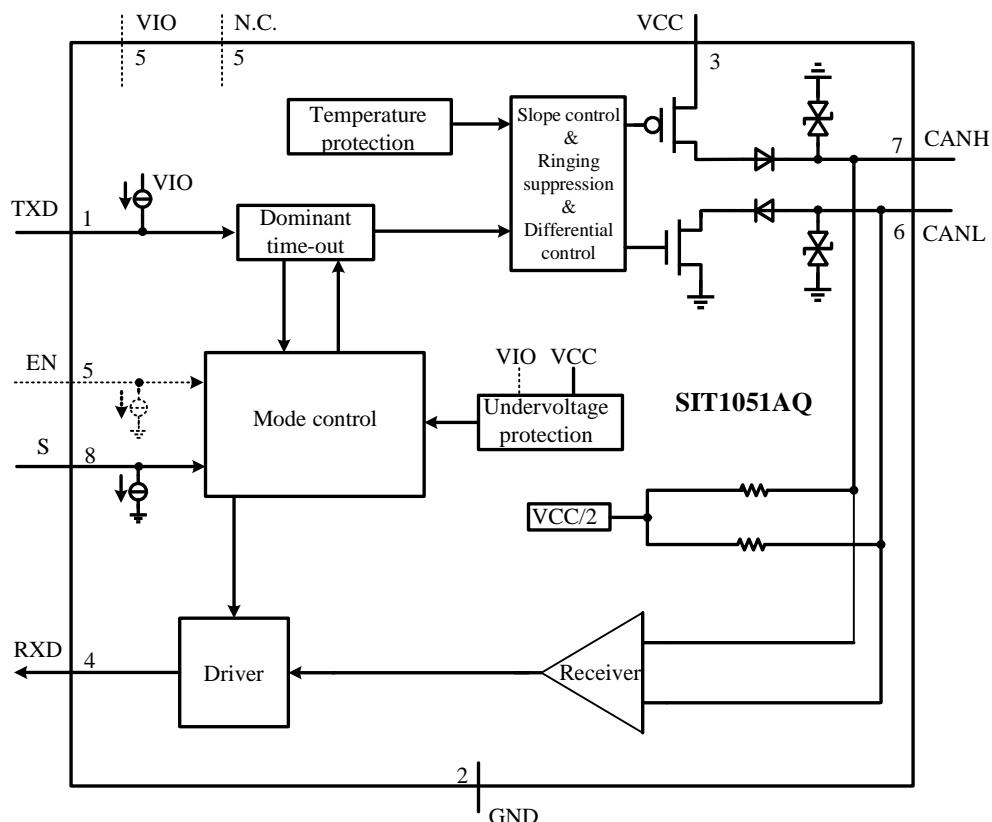

PARAMETER	SYMBOL	CONDITION	MIN.	MAX.	UNIT
Supply voltage	VCC		4.5	5.5	V

**LIMITING VALUES**

PARAMETER	SYMBOL	VALUE	UNIT
Supply voltage	VCC	-0.3~7	V
MCU side port	TXD, RXD, S, EN, VIO	-0.3~7	V
Bus side input voltage	CANL, CANH	-58~58	V
Bus differential breakdown voltage	V <sub>CANH-CANL</sub>	-27~27	V
Storage temperature		-55~150	°C
Virtual junction temperature		-40~150	°C
Welding temperature range		300	°C

The maximum limit parameters mean that exceeding these values may cause irreversible damage to the device. Under these conditions, it is not conducive to the normal operation of the device. The continuous operation of the device at the maximum allowable rating may affect the reliability of the device. The reference point for all voltages is ground.

**PINNING**

PIN	SYMBOL	DESCRIPTION
1	TXD	transmit data input
2	GND	ground
3	VCC	supply voltage
4	RXD	receive data output; reads out data from the bus lines
5	N.C.	no connection (SIT1051AQT version)
5	VIO	transceiver I/O level conversion power supply voltage (SIT1051AQT/3 version)
5	EN	off mode enable pin. The low level is the off mode (SIT1051AQT/E version)
6	CANL	LOW-level CAN-bus line
7	CANH	HIGH-level CAN-bus line
8	S	silent mode control input, low level is high speed mode

## ADDITIONAL DESCRIPTION

### 1 Sketch

SIT1051AQ is an interface chip applied between the CAN protocol controller and the physical bus. It can be applied to trucks, buses, cars, industrial control and other fields. It supports 5Mbps flexible data rate (CAN FD) and has the ability to transmit differential signals between the bus and the CAN protocol controller. Fully compatible with ISO 11898 standard.

### 2 Short-circuit protection

A current-limiting circuit protects the transmitter output stage from damage caused by accidental short-circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

### 3 Overtemperature protection

SIT1051AQ has an overtemperature protection function. When the overtemperature protection is triggered, the current of the driver stage will be reduced. Because the driver tube is the main energy consuming component, the current reduction will reduce the power consumption and thus reduce the chip temperature. Meanwhile, the rest of the chip still works.

### 4 Undervoltage protection

The SIT1051AQ power pin has an undervoltage detection function to place the device in protected mode, which can protect the bus (bus output high ohmic state) when VCC is below Vuvd\_VCC or VIO is below Vuvd\_VIO (if applicable).

### 5 Control mode

The control pin S allows two modes of operation to be selected: high speed mode and silent mode. The high-speed mode is the normal operating mode and is optional by grounding pin S or floating it. CAN driver and the receiver can work completely normally and CAN communication is bidirectional. Set pin S to high level to activate silent mode. The CAN driver will shut off and the receiver will continue working.

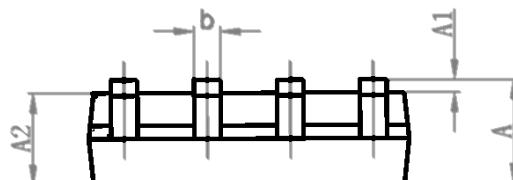

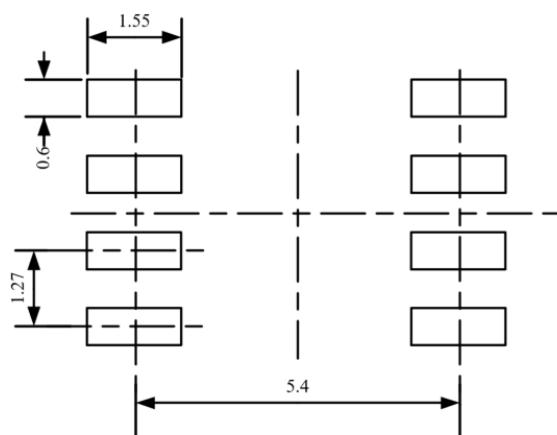

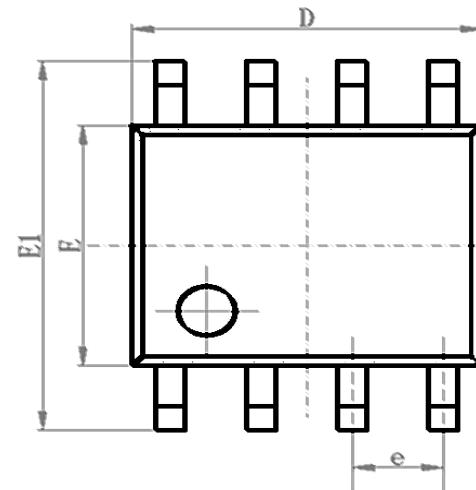

### 6 TXD dominant time-out function

A ‘TXD dominant time-out’ timer circuit prevents the bus lines from being driven to a permanent dominant state (blocking all network communication) if pin TXD is forced permanently LOW by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TXD.

If the duration of the LOW level on pin TXD exceeds the internal timer value ( $t_{dom}$ ), the transmitter is disabled, driving the bus lines into a recessive state. The timer is reset by a positive edge on pin TXD.
