

## GQ-131a HC Ozone Gas Sensor (High Concentration)

### Profile

Sensitive material of GQ-131a HC gas sensor is semiconductor metallic oxide, which with high conductivity in clean air. When the ozone gas exists, the sensor's conductivity gets lower along with the gas concentration rising. Users can convert the change of conductivity to correspond output signal of gas concentration through a simple circuit.

GQ-131a HC ozone gas sensor has high sensitivity to ozone, and also has sensitivity to strong oxide such as Cl<sub>2</sub>, NO<sub>2</sub> &etc. It responses oppositely to organic interference gases.

### Features

It has good sensitivity to ozone in wide range, and has advantages such as long lifespan, low cost and simple drive circuit &etc.

### Main Applications

It is widely used in domestic ozone concentration alarm, industrial ozone concentration alarm and portable ozone concentration detector.

### Technical Parameters

### Stable.1

Model			GQ-131a HC
Sensor Type			Semiconductor
Standard Encapsulation			Bakelite, Metal cap
Target Gas			Ozone
Detection range			10~1000ppm Ozone
Standard Circuit Conditions	Loop Voltage	V <sub>c</sub>	≤24V DC
	Heater Voltage	V <sub>H</sub>	5.0V±0.1V AC or DC
	Load Resistance	R <sub>L</sub>	Adjustable
Sensor character under standard test conditions	Heater Resistance	R <sub>H</sub>	31Ω±5Ω (room temp.)
	Heater consumption	P <sub>H</sub>	≤900mW
	Sensitivity	S	R <sub>s</sub> (in 200ppm O <sub>3</sub> ) / R <sub>s</sub> (in air)≥2
	Output Voltage	ΔV <sub>s</sub>	≥1.0V(in 200ppm O <sub>3</sub> )
	Concentration Slope	α	≤0.6( R <sub>10ppm</sub> /R <sub>100ppm</sub> O <sub>3</sub> )
Standard test conditions	Tem. Humidity		20°C±2°C; 55%±5%RH
	Standard test circuit		V <sub>c</sub> :5.0V±0.1V; V <sub>H</sub> : 5.0V±0.1V
	Preheat time		Over 48 hours

**Fig1.Sensor Structure**

Unit: mm

NOTE: The change of Output voltage(ΔV<sub>s</sub>) is the difference value between V<sub>RL</sub> in test environment and

### Basic Circuit

Fig2. GQ-131a HC HC Test Circuit

**Instructions:** The above fig is the basic test circuit of GQ-131a HC. The sensor requires two voltage inputs: heater voltage ( $V_H$ ) and circuit voltage ( $V_C$ ).  $V_H$  is used to supply standard working temperature to the sensor and it can adopt DC or AC power, while  $V_{RL}$  is the voltage of load resistance  $R_L$  which is in series with sensor.  $V_C$  supplies the detect voltage to load resistance  $R_L$  and it should adopt DC power.

### Description of Sensor Characters

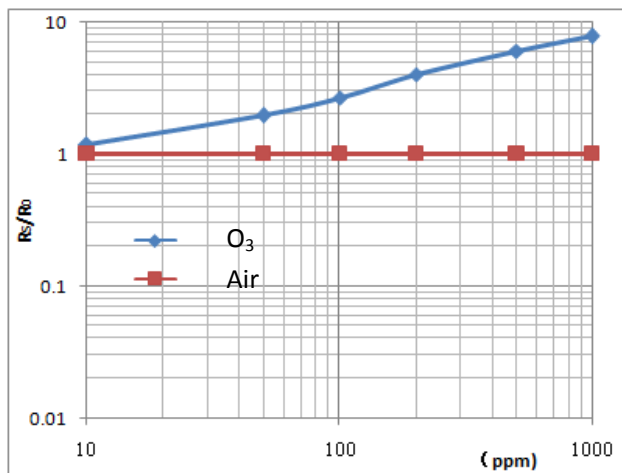

Fig3. Typical Sensitivity Curve

The ordinate is resistance ratio of the sensor ( $R_s/R_0$ ), the abscissa is concentration of gases.  $R_s$  means resistance in target gas with different concentration,  $R_0$  means resistance of sensor in clean air. All tests are finished under standard test conditions.

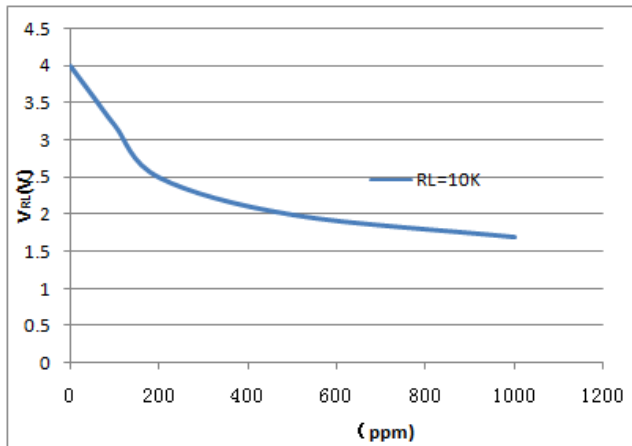

Fig4. Typical temperature/humidity characteristics

The ordinate is resistance ratio of the sensor ( $R_s/R_{s0}$ ).  $R_s$  means resistance of sensor in 200ppm  $O_3$  gas under different tem. and humidity.  $R_{s0}$  means resistance of the sensor in 200ppm  $O_3$  gas under 20°C/55%RH.

**Fig5.Sensitivity Curve**

Fig5 shows the  $V_{RL}$  in  $O_3$  gas with different concentration. The resistance load  $R_L$  is 10 K $\Omega$  and the test is finished in standard test conditions.

**Fig6.Response and Resume**

Fig5 shows the changing of  $V_{RL}$  in the process of putting the sensor into target gas and removing it out.

## Cautions

### 1 .Following conditions must be prohibited

#### 1.1 Exposed to organic silicon steam

Sensing material will lose sensitivity and never recover if the sensor absorbs organic silicon steam. Sensors must avoid exposing to silicon bond, fixture, silicon latex, putty or plastic contain silicon environment.

#### 1.2 High Corrosive gas

If the sensors are exposed to high concentration corrosive gas (such as  $H_2S$ ,  $SO_x$ ,  $Cl_2$ ,  $HCl$  etc.), it will not only result in corrosion of sensors structure, also it cause sincere sensitivity attenuation.

#### 1.3 Alkali, Alkali metals salt, halogen pollution

The sensors performance will be changed badly if sensors be sprayed polluted by alkali metals salt especially brine, or be exposed to halogen such as fluorine.

#### 1.4 Touch water

Sensitivity of the sensors will be reduced when spattered or dipped in water.

#### 1.5 Freezing

Do avoid icing on sensor's surface, otherwise sensing material will be broken and lost sensitivity.

#### 1.6 Applied higher voltage

Applied voltage on sensor should not be higher than stipulated value, even if the sensor is not physically damaged or broken, it causes down-line or heater damaged, and bring on sensors' sensitivity characteristic changed badly.

#### 1.7 Voltage on wrong pins

For 6 pins sensor, Pin 2&5 is heating electrodes, Pin (1,3)/(4,6) are testing electrodes (Pin 1 connects with Pin 3, while Pin 4 connects with Pin 6).If apply voltage on Pin 1&3 or 4&6, it will make lead broken; and no signal putout if apply on pins 2&4.

**Fig7. Lead sketch**

**2 .Following conditions must be avoided**

**2.1 Water Condensation**

Indoor conditions, slight water condensation will influence sensors’ performance lightly. However, if water condensation on sensors surface and keep a certain period, sensors’ sensitive will be decreased.

**2.2 Used in high gas concentration**

No matter the sensor is electrified or not, if it is placed in high gas concentration for long time, sensors characteristic will be affected. If lighter gas sprays the sensor, it will cause extremely damage.

**2.3 Long time storage**

The sensors resistance will drift reversibly if it’s stored for long time without electrify, this drift is related with storage conditions. Sensors should be stored in airproof bag without volatile silicon compound. For the sensors with long time storage but no electrify, they need long galvanical aging time for stability before using. The suggested aging time as follow:

**Stable2.**

<b>Storage Time</b>	<b>Suggested aging time</b>
Less than one month	No less than 48 hours
1 ~ 6 months	No less than 72 hours
More than six months	No less than 168 hours

**2.4 Long time exposed to adverse environment**

No matter the sensors electrified or not, if exposed to adverse environment for long time, such as high humidity, high temperature, or high pollution etc., it will influence the sensors’ performance badly.

**2.5 Vibration**

Continual vibration will result in sensors down-lead response then break. In transportation or assembling line, pneumatic screwdriver/ultrasonic welding machine can lead this vibration.

**2.6 Concussion**

If sensors meet strong concussion, it may lead its lead wire disconnected.

**2.7 Usage Conditions**

2.7.1For sensor, handmade welding is optimal way. The welding conditions as follow:

- Soldering flux: Rosin soldering flux contains least chlorine
- homothermal soldering iron
- Temperature: 250°C
- Time: less than 3 seconds

2.7.1If users choose wave-soldering, the following conditions should be obey:

- Soldering flux: Rosin soldering flux contains least chlorine
- Speed: 1-2 Meter/ Minute
- Warm-up temperature: 100±20°C
- Welding temperature: 250±10°C
- One time pass wave crest welding machine
